Brief Paper

## **Ironies of Automation\***

LISANNE BAINBRIDGE†

**Key Words**—Control engineering computer applications; man–machine systems; on-line operation; process control; system failure and recovery.

**Abstract**—This paper discusses the ways in which automation of industrial processes may expand rather than eliminate problems with the human operator. Some comments will be made on methods of alleviating these problems within the ‘classic’ approach of leaving the operator with responsibility for abnormal conditions, and on the potential for continued use of the human operator for on-line decision-making within human–computer collaboration.

*Irony*: combination of circumstances, the result of which is the direct opposite of what might be expected.

*Paradox*: seemingly absurd though perhaps really well-founded

designer errors can be a major source of operating problems. Unfortunately people who have collected data on this are reluctant to publish them, as the actual figures are difficult to interpret. (Some types of error may be reported more readily than others, and there may be disagreement about their origin.) The second irony is that the designer who tries to eliminate the operator still leaves the operator to do the tasks which the designer cannot think how to automate. It is this approach which causes the problems to be discussed here, as it means that the operator can be left with an arbitrary collection of tasks, and little thought may have been given to providing support for them.

Brief Paper

## **Ironies of Automation\***

LISANNE BAINBRIDGE†

... factors are important.” This paper suggests that the increased interest in human factors among engineers reflects the irony that the more advanced a control system is, so the more crucial may be the contribution of the human operator.

Abstr  
indus  
with

methods of alleviating these problems within the ‘classic’ approach of leaving the operator with responsibility for abnormal conditions, and on the potential for continued use of the human operator for on-line decision-making within human-computer collaboration.

*Irony*: combination of circumstances, the result of which is the direct opposite of what might be expected.

*Paradox*: seemingly absurd though perhaps really well-founded

blems.  
is are  
cult to

interpret. (Some types of error may be reported more readily than others, and there may be disagreement about their origin.) The second irony is that the designer who tries to eliminate the operator still leaves the operator to do the tasks which the designer cannot think how to automate. It is this approach which causes the problems to be discussed here, as it means that the operator can be left with an arbitrary collection of tasks, and little thought may have been given to providing support for them.

# Ironic Automation

- ✦ Manual skills deteriorate when they **are not used**.
- ✦ The generation of “new strategies” requires an **adequate knowledge of the [system]**.
- ✦ “There is some concern that the present generation of automated systems, which are monitored by former manual operators, are riding on their skills, which **later generations of operators cannot be expected to have**.”
- ✦ Automation generally requires a **speed versus correctness tradeoff**.
- ✦ Automation can **camouflage** current system state.

# Ironic Automation, continued

- Automatic systems **should fail obviously**.

@LateNightSeth

**YA THINK?**

#SREcon

@jpaulreed

# Ironic Automation, continued

- ✦ Automatic systems **should fail obviously**.
- ✦ Tracing the decision trees made by algorithms **can be difficult** (*or today, impossible*).
- ✦ This leads to the **inability to fully understand the current context of the system** when you are paged.

How did I get into  
*this* mode?

How do I **stop it**  
from doing this?

**Why  
did  
it  
do  
this?**

**What it is doing now?!**

*I know there is some way to get it  
to do what I want...*

**Stop interrupting me  
while I'm busy!**

**What will it do next?**

# Ironic Automation, continued

- ✦ Automatic systems **should fail obviously**.
- ✦ Tracing the decision trees made by algorithms **can be difficult (or impossible)**.
- ✦ This leads to the **inability to fully understand the current context of the system** when you are paged.
- ✦ “It is **ironic** to train operators to follow instructions, and then put them in the system to **provide intelligence to it.**”

# Other Problematic Automation Aspects

---

- ✦ Automation often **disconnected or treated distinctly** from the application.
- ✦ Automation is not **co-evolved** with the application or **treated as a product**.
- ✦ Teams can (oddly?) **devalue the implementation / ownership** of automation
