

Cloudy with a Chance of Chaos

Christina Yakomin

@SREChristina

Chaos and Resilience Engineering at Vanguard

What is Chaos Engineering?

“Breaking things on purpose”

“I know it’s something Netflix does, but we could never do that here!”

“Isn’t that just a fancy name for performance testing? It’s another buzzword.”

“Um.. what the heck is that?”

Chaos Engineering = Resilience Testing

“ Chaos Engineering is the discipline of experimenting on a distributed system in order to build confidence in the system’s capability to withstand turbulent conditions in production. ”

- Principles of Chaos

Why is Chaos Engineering Valuable?

Infrastructure fails all the time

Validate automated resilience mechanisms

Train incident responders and engineers on-call

Build vs. Buy

~~Open Source Tool~~

~~Vendor Product~~

Build our own lean MVP

The Climate of Chaos

Please select the desired phenomenon.

ECS

RDS

EC2

PCF

Libraries

ECS

API Based Phenomena

Chaos Cyclone

Task termination - terminates random ECS task(s) within the cluster inputted

Chaos Drought

"Unavailable app" - sets the ECS task count to zero within the cluster inputted for a specified period of time

Chaos Tornado

Task termination - terminates specified ECS task(s) within the cluster inputted

Agent Based Phenomena

Chaos Flash Flood

CPU Attack - consumes CPU resources on specified ECS tasks for a given period of time

Chaos Mudslide

Memory Consumption - reduces available memory of specified ECS tasks for a given period of time

The Climate of Chaos

Chaos ECS Flash Flood

Invoke with Steady State Probe? *

Yes

No

Run

Emergency Stop

Our Guiding Principles

Serverless

Easy Adoption

Defined Guardrails

Integrated Reporting

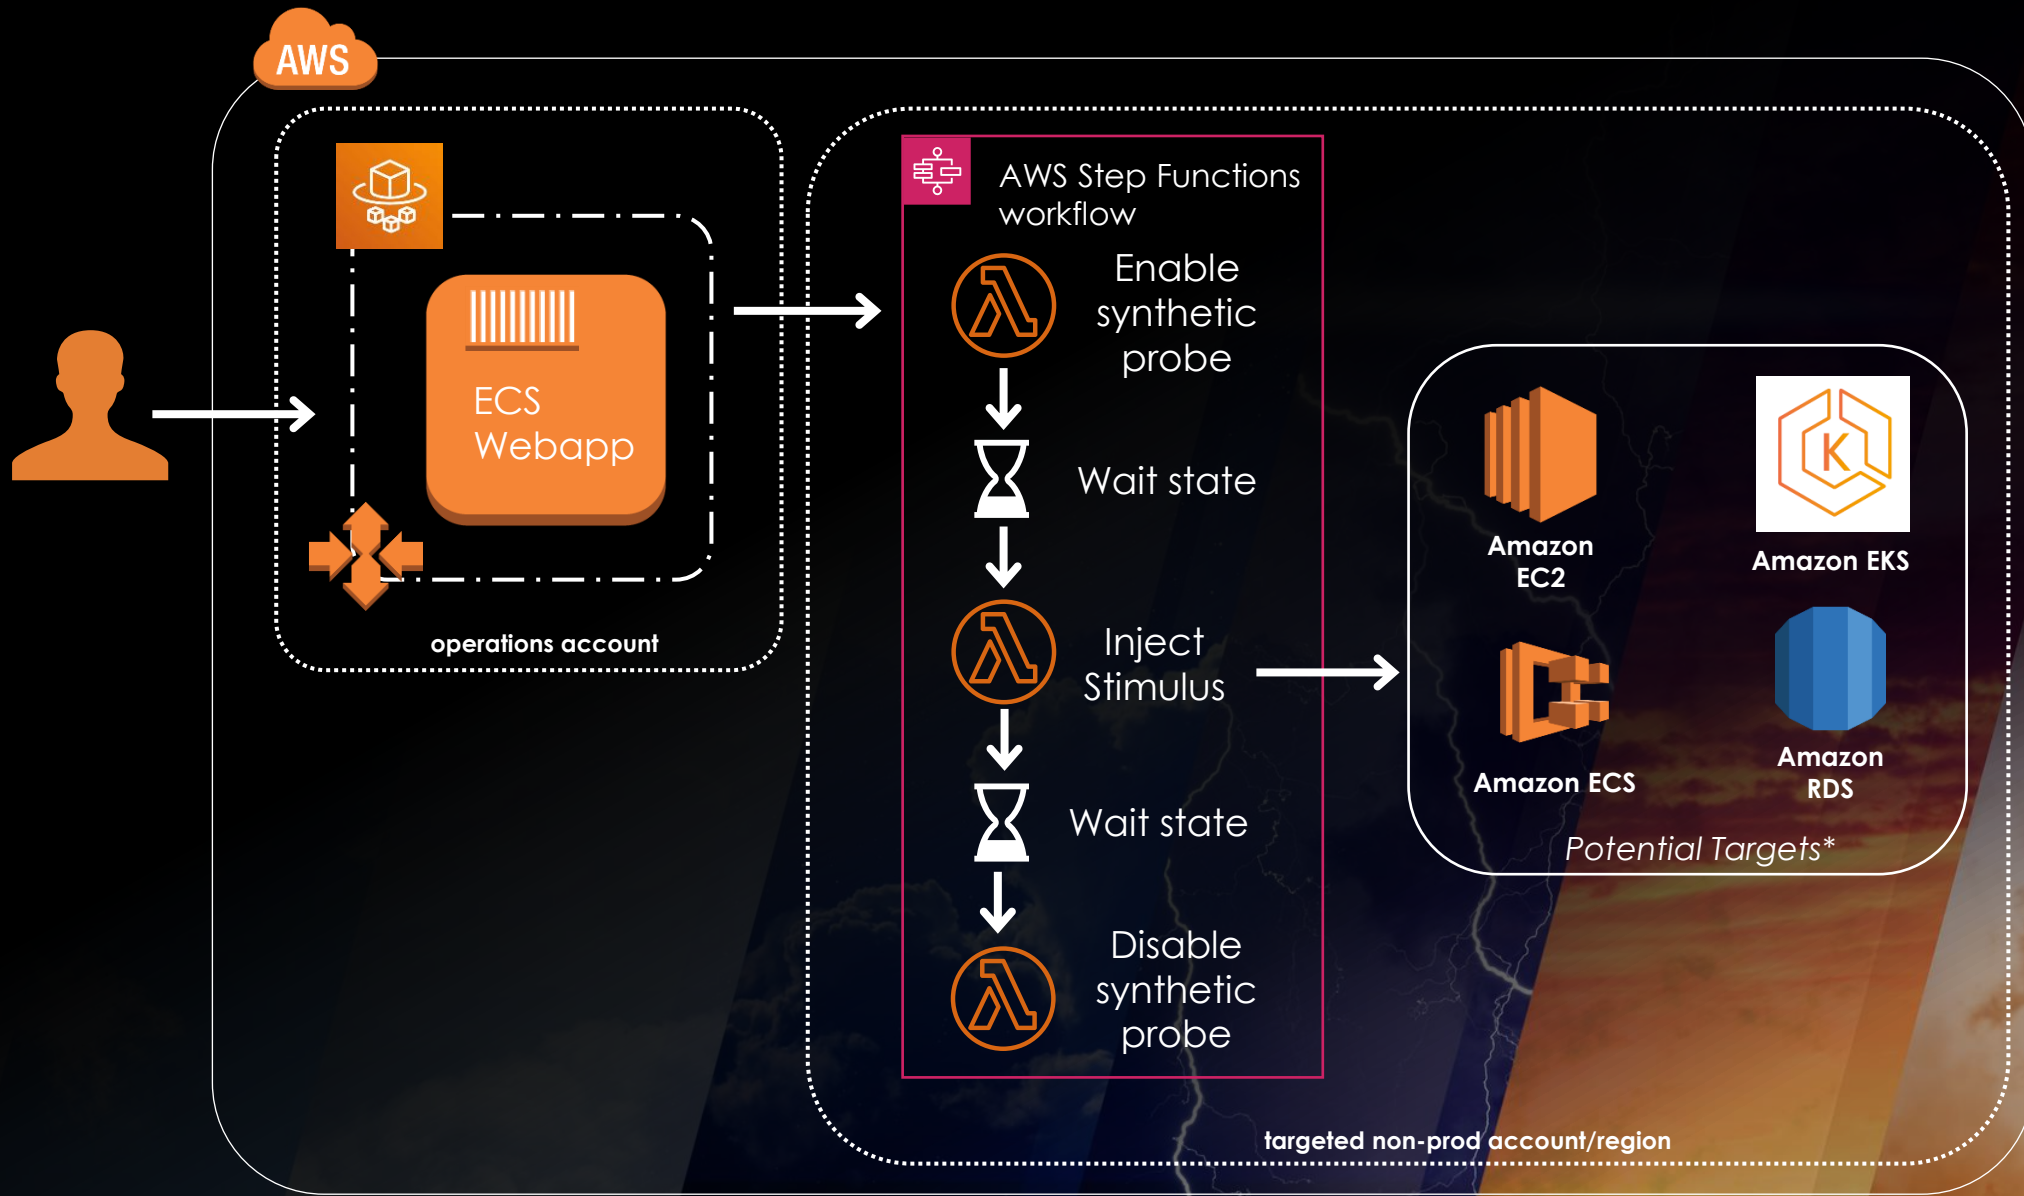

Serverless Architecture

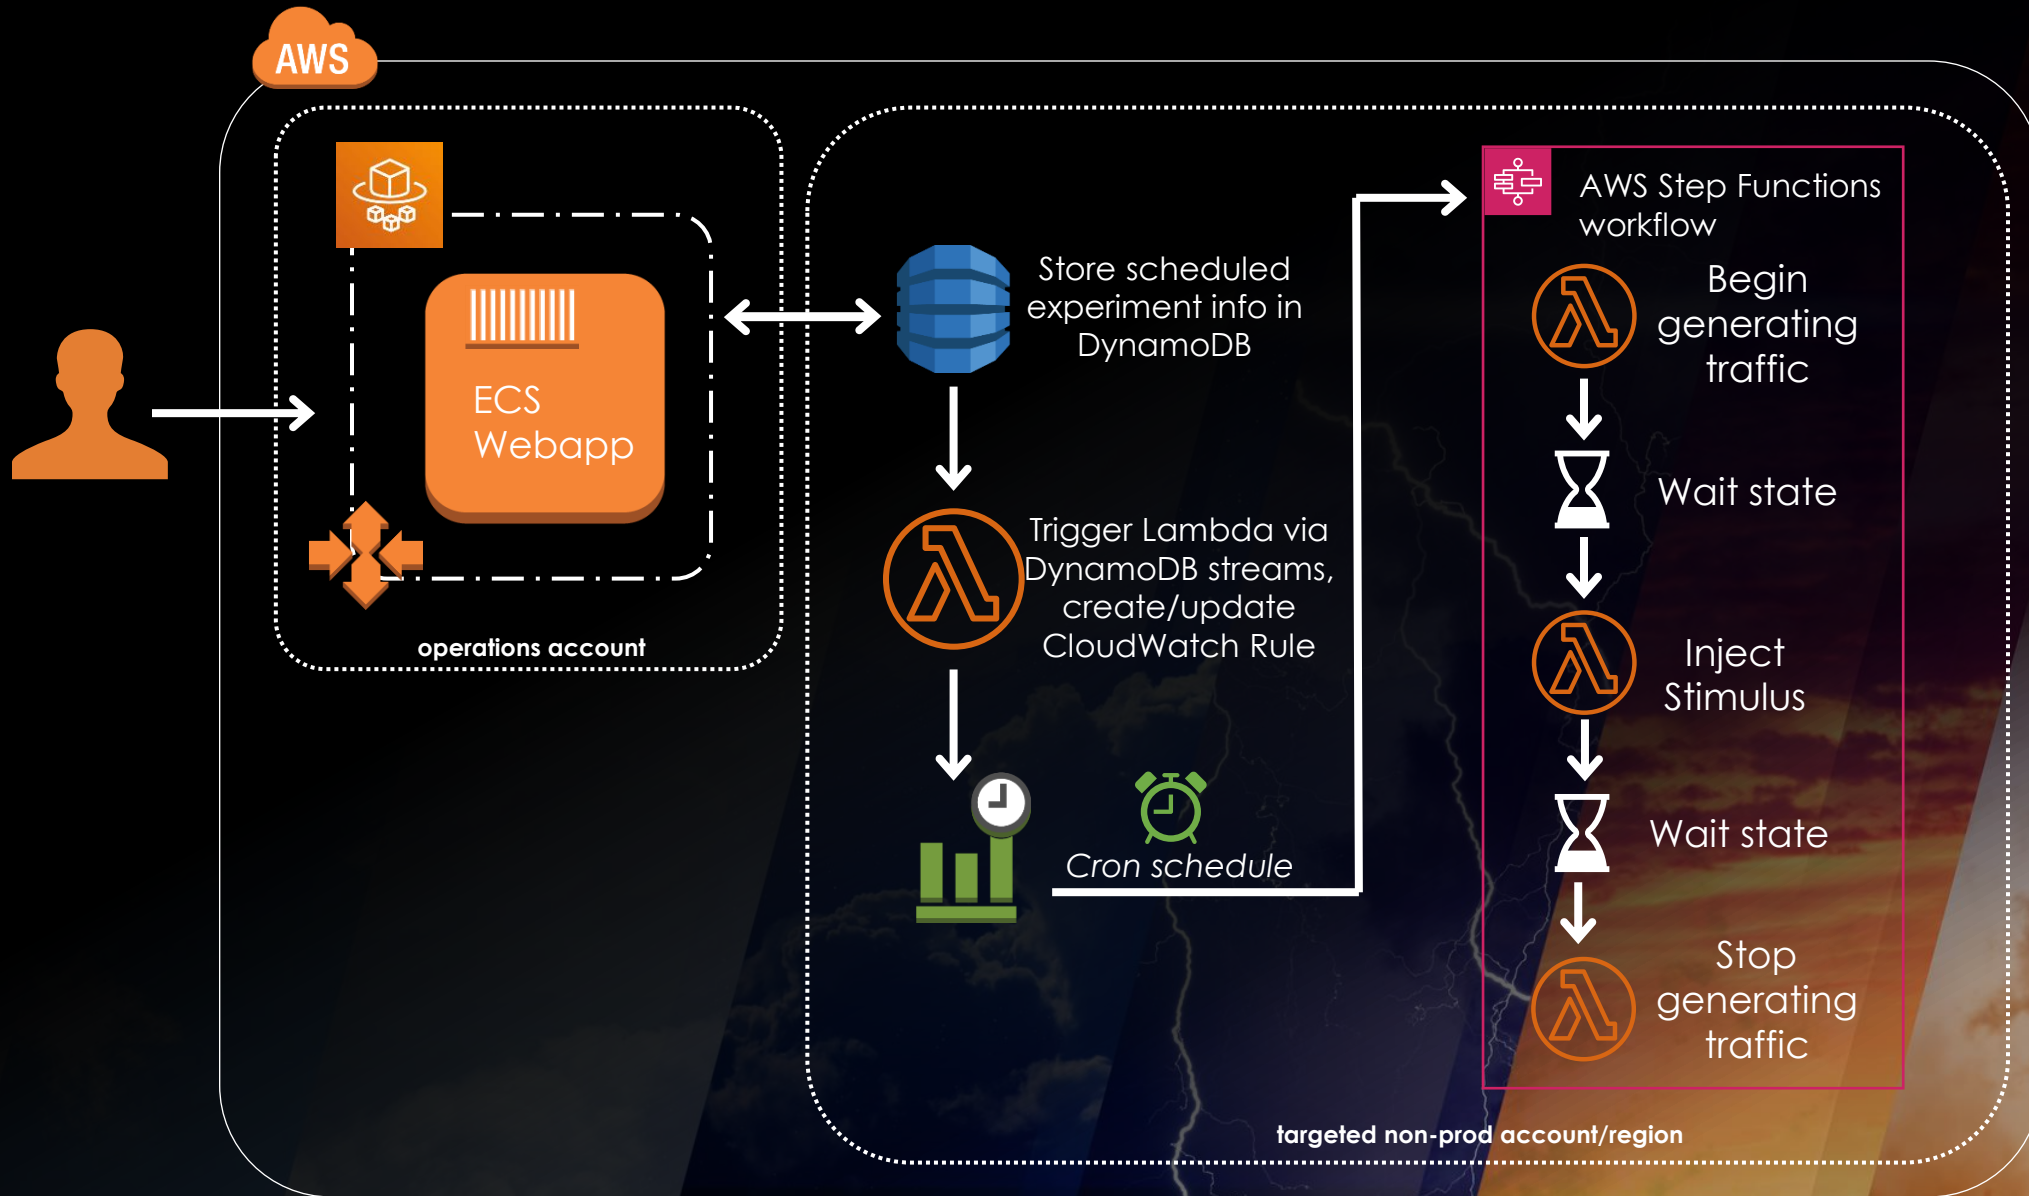

AWS ECS Fargate web application

AWS Lambda with Step Functions

AWS DynamoDB

AWS CloudWatch Events

Climate Control State Machine

Easy Adoption

Self-service model

No code changes needed!

Well-documented tool

Defined Guardrails

Minimize blast radius

Tag-based permissions

Non-production only, for now...

Integrated Reporting

Fault injection is only useful if you can see the results!

Enable creation of “steady state probes”

Common dashboards for visualization

What's next for our team?

Continue to develop new phenomena

Focus on coaching to encourage broader adoption

Introduce more complex tools that do require minor code changes

More advanced automation and scheduling

Thank you!!
